Multiple Inheritance in C++: Hierarchy

Module 35

Partha Pratim Das

Objectives & Outline

Multiple Inheritance in C++

Semantics

Data Members

Overrides and Overloads

protected Access

Constructor & Destructor

Object Lifetime

Diamond Problem

Exercise

Design Choice

Summary

- TA ISA Student; TA ISA Faculty

```
class Student; // Base Class = Student
class Faculty; // Base Class = Faculty
class TA: public Student, public Faculty; // Derived Class = TA
```

- TA inherits properties and operations of both Student as well as Faculty

Multiple Inheritance in C++: Hierarchy

Module 35

Partha Pratim Das

Objectives & Outline

Multiple Inheritance in C++

Semantics

Data Members

Overrides and Overloads

protected Access

Constructor & Destructor

Object Lifetime

Diamond Problem

Exercise

Design Choice

Summary

- **Manager ISA Employee, Director ISA Employee, ManagingDirector ISA Manager, ManagingDirector ISA Director**

```
class Employee; // Base Class = Employee -- Root
class Manager: public Employee; // Derived Class = Manager
class Director: public Employee; // Derived Class = Director
class ManagingDirector: public Manager, public Director; // Derived Class = ManagingDirector
```

- **Manager** inherits properties and operations of **Employee**
- **Director** inherits properties and operations of **Employee**
- **ManagingDirector** inherits properties and operations of both **Manager** as well as **Director**
- **ManagingDirector**, by transitivity, inherits properties and operations of **Employee**
- **Multiple inheritance hierarchy usually has a common base class**
- This is known as the **Diamond Hierarchy**

Multiple Inheritance in C++: Semantics

Module 35

Partha Pratim Das

Objectives & Outline

Multiple Inheritance in C++

Semantics

Data Members

Overrides and Overloads

protected Access

Constructor & Destructor

Object Lifetime

Diamond Problem

Exercise

Design Choice

Summary

- Derived **ISA** Base1, Derived **ISA** Base2

```
class Base1;           // Base Class = Base1
class Base2;           // Base Class = Base2
class Derived: public Base1, public Base2;
                        // Derived Class = Derived
```

- Use keyword **public** after class name to denote inheritance
- Name of the Base class follow the keyword
- There may be more than two base classes
- public** and **private** inheritance may be mixed

Multiple Inheritance in C++: Semantics

Exercise

Design Choice

Summary

- **Derived ISA Base1, Base2**
- **Data Members**
 - **Derived** class *inherits all* data members of *all Base* classes
 - **Derived** class may *add* data members of its own
- **Member Functions**
 - **Derived** class *inherits all* member functions of *all Base* classes
 - **Derived** class may *override* a member function of *any Base* class by *redefining* it with the *same signature*
 - **Derived** class may *overload* a member function of *any Base* class by *redefining* it with the *same name*; but *different signature*
- **Access Specification**
 - **Derived** class *cannot access private* members of *any Base* class
 - **Derived** class *can access protected* members of *any Base* class
- **Construction-Destruction**
 - A *constructor* of the **Derived** class *must first* call *all constructors* of the **Base** classes to construct the **Base** class instances of the **Derived** class – **Base** class *constructors* are called in *listing order*
 - The *destructor* of the **Derived** class *must* call the *destructors* of the **Base** classes to destruct the **Base** class instances of the **Derived** class

Multiple Inheritance in C++: Data Members and Object Layout

Module 35

Partha Pratim Das

Objectives & Outline

Multiple Inheritance in C++

Semantics

Data Members

Overrides and Overloads

protected Access

Constructor & Destructor

Object Lifetime

Diamond Problem

Exercise

Design Choice

Summary

- Derived **ISA** Base1, Base2
- Data Members
 - Derived class *inherits all* data members of *all* Base classes
 - Derived class may *add* data members of its own
- Object Layout
 - Derived class *layout* contains instances of *each* Base class
 - Further, Derived class *layout* will have data members of its own
 - C++ does not guarantee the *relative position* of the Base class instances and Derived class members

Multiple Inheritance in C++:

Data Members and Object Layout

Module 35

Partha Pratim Das

Objectives & Outline

Multiple Inheritance in C++

Semantics

Data Members

Overrides and Overloads

protected Access

Constructor & Destructor

Object Lifetime

Diamond Problem

Exercise

Design Choice

Summary

```
class Base1 { protected:
    int i_;
    int data_;
public: // ...
};
class Base2 { protected:
    int j_;
    int data_;
public: // ...
};
class Derived : public Base1, public Base2 {
    int k_;
public: // ...
};
```

Object Layout

Object Base1

Object Base2

Object Derived

Object Derived has two data_ member!

Ambiguity to be resolved with base class name: `Base1::data_` & `Base2::data_`

Multiple Inheritance in C++:

Member Functions – Overrides and Overloads

Design Choice

Summary

- Derived **ISA** Base1, Base2
- Member Functions
 - Derived class *inherits all* member functions of *all* Base classes
 - Derived class may *override* a member function of *any* Base class by *redefining* it with the *same signature*
 - Derived class may *overload* a member function of *any* Base class by *redefining* it with the *same name*; but *different signature*
- Static Member Functions
 - Derived class *does not inherit* the static member functions of *any* Base class
- Friend Functions
 - Derived class *does not inherit* the friend functions of *any* Base class

Multiple Inheritance in C++:

Member Functions – Overrides and Overloads

Module 35

Partha Pratim Das

Objectives & Outline

Multiple Inheritance in C++

Semantics

Data Members

Overrides and Overloads

protected Access

Constructor & Destructor

Object Lifetime

Diamond Problem

Exercise

Design Choice

Summary

```
class Base1 { protected:
    int i_;
    int data_;
public: Base1(int a, int b) : i_(a), data_(b);
    void f(int) { cout << "Base1::f(int) "; }
    void g() { cout << "Base1::g() "; }
};

class Base2 { protected:
    int j_;
    int data_;
public: Base2(int a, int b) : j_(a), data_(b);
    void h(int) { cout << "Base2::h(int) "; }
};

class Derived : public Base1, public Base2 {
    int k_;
public: Derived(int x, int y, int u, int v, int z);
    void f(int) { cout << "Derived::f(int) "; } // -- Overridden Base1::f(int)
    // -- Inherited Base1::g()
    void h(string) { cout << "Derived::h(string) "; } // -- Overloaded Base2:: h(int)
    void e(char) { cout << "Derived::e(char) "; } // -- Added Derived::e(char)
};

Derived c(1, 2, 3, 4, 5);

c.f(5); // Derived::f(int) -- Overridden Base1::f(int)
c.g(); // Base1::g() -- Inherited Base1::g()
c.h("ppd"); // Derived::h(string) -- Overloaded Base2:: h(int)
c.e('a'); // Derived::e(char) -- Added Derived::e(char)
```

Inheritance in C++:

Member Functions – using for Name Resolution

Module 35

Partha Pratim Das

Objectives & Outline

Multiple Inheritance in C++

Semantics
Data Members
Overrides and Overloads
protected Access
Constructor & Destructor
Object Lifetime

Diamond Problem
Exercise
Design Choice

Summary

Ambiguous Calls

```
class Base1 { public:
    Base1(int a, int b) : i_(a), data_(b);
    void f(int) { cout << "Base1::f(int) "; }
    void g() { cout << "Base1::g() "; }
};
class Base2 { public:
    Base2(int a, int b) : j_(a), data_(b);
    void f(int) { cout << "Base2::f(int) "; }
    void g(int) { cout << "Base2::g(int) "; }
};
class Derived : public Base1, public Base2 {
public: Derived(int x, int y, int u,
               int v, int z);
};

Derived c(1, 2, 3, 4, 5);

c.f(5); // Base1::f(int) or Base2::f(int)?
c.g(5); // Base1::g() or Base2::g(int)?
c.f(3); // Base1::f(int) or Base2::f(int)?
c.g();  // Base1::g() or Base2::g(int)?
```

Unambiguous Calls

```
class Base1 { public:
    Base1(int a, int b) : i_(a), data_(b);
    void f(int) { cout << "Base1::f(int) "; }
    void g() { cout << "Base1::g() "; }
};
class Base2 { public:
    Base2(int a, int b) : j_(a), data_(b);
    void f(int) { cout << "Base2::f(int) "; }
    void g(int) { cout << "Base2::g(int) "; }
};
class Derived : public Base1, public Base2 {
public: Derived(int x, int y, int u,
               int v, int z);
        using Base1::f; // Hides Base2::f
        using Base2::g; // Hides Base1::g
};

Derived c(1, 2, 3, 4, 5);

c.f(5);          // Base1::f(int)
c.g(5);          // Base2::g(int)
c.Base2::f(3);   // Base2::f(int)
c.Base1::g();    // Base1::g()
```

- **Overload resolution does not work between `Base1::g(int)` and `Base2::g()`**
- **`using` hides other candidates**
- **Explicit use of base class name can resolve (weak solution)**

Multiple Inheritance in C++:

Access Members of Base: protected Access

Module 35

Partha Pratim Das

Objectives & Outline

Multiple Inheritance in C++

Semantics

Data Members

Overrides and Overloads

protected Access

Constructor & Destructor

Object Lifetime

Diamond Problem

Exercise

Design Choice

Summary

```
class Base1 { protected: int i_; int data_;
public: Base1(int a, int b) : i_(a), data_(b) { cout << "Base1::Base1() "; }
      ~Base1() { cout << "Base1::~~Base1() "; }
};
class Base2 { protected: int j_; int data_;
public:
      Base2(int a = 0, int b = 0) : j_(a), data_(b) { cout << "Base2::Base2() "; }
      ~Base2() { cout << "Base2::~~Base2() "; }
};
class Derived : public Base1, public Base2 { int k_;
public:
      Derived(int x, int y, int z) :
          Base1(x, y), k_(z) { cout << "Derived::Derived() "; }
          // Base1::Base1 explicit, Base2::Base2 default
      ~Derived() { cout << "Derived::~~Derived() "; }
};

Derived d(5, 3, 2);
```

Construction O/P	Destruction O/P
Base1::Base1(): 5, 3 // Obj. d.Base1	Derived::~~Derived(): 2 // Obj. d
Base2::Base2(): 0, 0 // Obj. d.Base2	Base2::~~Base2(): 0, 0 // Obj. d.Base2
Derived::Derived(): 2 // Obj. d	Base1::~~Base1(): 3, 5 // Obj. d.Base1

- First construct base class objects, then derived class object
- First destruct derived class object, then base class objects

Multiple Inheritance in C++: Diamond Problem

Module 35

Partha Pratim Das

Objectives & Outline

Multiple Inheritance in C++

Semantics
Data Members
Overrides and Overloads
protected Access
Constructor & Destructor
Object Lifetime

Diamond Problem

Exercise

Design Choice

Summary

- **Student ISA Person**
- **Faculty ISA Person**
- **TA ISA Student; TA ISA Faculty**

```
class Person; // Base Class = Person -- Root
class Student: public Person; // Base / Derived Class = Student
class Faculty: public Person; // Base / Derived Class = Faculty
class TA: public Student, public Faculty; // Derived Class = TA
```

- **Student** inherits properties and operations of **Person**
- **Faculty** inherits properties and operations of **Person**
- **TA** inherits properties and operations of both **Student** as well as **Faculty**
- **TA**, by transitivity, inherits properties and operations of **Person**

Multiple Inheritance in C++:

Diamond Problem

Module 35

Partha Pratim Das

Objectives & Outline

Multiple Inheritance in C++

Semantics
Data Members
Overrides and Overloads
protected Access
Constructor & Destructor
Object Lifetime

Diamond Problem

Exercise

Design Choice

Summary

```
#include<iostream>
using namespace std;

class Person { // Data members of person
public: Person(int x) { cout << "Person::Person(int)" << endl; }
};

class Faculty : public Person { // data members of Faculty
public: Faculty(int x) :Person(x) { cout << "Faculty::Faculty(int)" << endl; }
};

class Student : public Person { // data members of Student
public: Student(int x) :Person(x) { cout << "Student::Student(int)" << endl; }
};

class TA : public Faculty, public Student {
public: TA(int x) :Student(x), Faculty(x) { cout << "TA::TA(int)" << endl; }
};

int main() {
    TA ta(30);

    return 0;
}

-----
Person::Person(int)
Faculty::Faculty(int)
Person::Person(int)
Student::Student(int)
TA::TA(int)
```

• Two instances of base class object (Person) in a TA object!

Multiple Inheritance in C++:

virtual Inheritance – virtual Base Class

Module 35

Partha Pratim Das

Objectives & Outline

Multiple Inheritance in C++

Semantics
Data Members
Overrides and Overloads
protected Access
Constructor & Destructor
Object Lifetime

Diamond Problem

Exercise

Design Choice

Summary

```
#include<iostream>
using namespace std;

class Person { // Data members of person
public: Person(int x) { cout << "Person::Person(int)" << endl; }
       Person() { cout << "Person::Person()" << endl; } // Default ctor for virtual inheritance
};

class Faculty : virtual public Person { // data members of Faculty
public: Faculty(int x) :Person(x) { cout << "Faculty::Faculty(int)" << endl; }
};

class Student : virtual public Person { // data members of Student
public: Student(int x) :Person(x) { cout << "Student::Student(int)" << endl; }
};

class TA : public Faculty, public Student {
public: TA(int x) :Student(x), Faculty(x) { cout << "TA::TA(int)" << endl; }
};

int main() {
    TA ta(30);

    return 0;
}

-----
Person::Person()
Faculty::Faculty(int)
Student::Student(int)
TA::TA(int)
```

- Introduce a default constructor for root base class Person
- Prefix every inheritance of Person with virtual
- Only one instance of base class object (Person) in a TA object!

Multiple Inheritance in C++:

virtual Inheritance with Parameterized Ctor

Module 35

Partha Pratim Das

Objectives & Outline

Multiple Inheritance in C++

Semantics
Data Members
Overrides and Overloads
protected Access
Constructor & Destructor
Object Lifetime

Diamond Problem

Exercise

Design Choice

Summary

```
#include<iostream>
using namespace std;
class Person {
public: Person(int x) { cout << "Person::Person(int)" << endl; }
    Person() { cout << "Person::Person()" << endl; }
};
class Faculty : virtual public Person {
public: Faculty(int x) :Person(x) { cout << "Faculty::Faculty(int)" << endl; }
};
class Student : virtual public Person {
public: Student(int x) :Person(x) { cout << "Student::Student(int)" << endl; }
};
class TA : public Faculty, public Student {
public:
    TA(int x):Student(x), Faculty(x), Person(x) { cout << "TA::TA(int)" << endl; }
};
int main() {
    TA ta(30);

    return 0;
}
-----
Person::Person(int)
Faculty::Faculty(int)
Student::Student(int)
TA::TA(int )
```

• Call parameterized constructor of root base class Person from constructor of TA class

Multiple Inheritance in C++:

Ambiguity

Module 35

Partha Pratim Das

Objectives & Outline

Multiple Inheritance in C++

Semantics

Data Members

Overrides and Overloads

protected Access

Constructor & Destructor

Object Lifetime

Diamond Problem

Exercise

Design Choice

Summary

```
#include<iostream>
using namespace std;
class Person {
public: Person(int x) { cout << "Person::Person(int)" << endl; }
    Person() { cout << "Person::Person()" << endl; }
    virtual ~Person();
    virtual void teach() = 0;
};
class Faculty : virtual public Person {
public: Faculty(int x) :Person(x) { cout << "Faculty::Faculty(int)" << endl; }
    virtual void teach();
};
class Student : virtual public Person {
public: Student(int x) :Person(x) { cout << "Student::Student(int)" << endl; }
    virtual void teach();
};
class TA : public Faculty, public Student {
public:
    TA(int x):Student(x), Faculty(x) { cout << "TA::TA(int)" << endl; }
    virtual void teach();
};
```

● In the absence of `TA::teach()`, which of `Student::teach()` or `Faculty::teach()` should be inherited?

Multiple Inheritance in C++:

Exercise

Module 35
